

Review of Reviews – Case Study

PROBLEM STATEMENT: Review of a software could range from an informal walk-through without comments to peer-reviews that capture comments, panel-reviews and verification-cycles. This project is about analyzing the text in a series of reviews done over a period of time.

AIM: To help the software owner understand the tone or sentiment of the feedback provided by users at large.

USE-CASE: The product owner can take the output project file and perform data analysis on it. Analysis like drawing bar graphs showing most frequent words used in comments, word clouds and reports can be used to understand how users have reacted to the software over time.

Below diagram shows how our project has been divided into two major sub parts and how each module interacts with each other and helps in fulfilling the aim of our project.

HIGH LEVEL DESIGN – DIAGRAM: The diagram below gives a high level overview, how we have planned to implement the project.
